

# Homework Assignment 1

**Due Date:** February 25, 2022, 23:59

EXERCISE 1. For  $k \in \mathbb{N}, k \geq 1$  define an operation *delete\_last*( $\ell, k$ ), which deletes the last  $k$  elements in a list  $\ell$ . Analyse the amortised complexity of this operation and show that it is in  $\Theta(1)$ , independent of  $k$ .

**total points: 8**

EXERCISE 2. Explore structural recursion on list objects, i.e. define an operation *src*[ $e, f, g$ ] in the following way:

- If  $\ell$  is the empty list, then  $\text{src}[e, f, g](\ell) = e$ , where  $e \in T'$  is some constant.
- If  $\ell$  is a singleton list containing just one element  $x$ , then  $\text{src}[e, f, g](\ell) = f(x)$ , where  $f$  is a function that maps elements of a set  $T$  (the set of list elements) to elements of a set  $T'$ .
- If  $\ell$  can be written as the concatenation of two lists, say  $\ell = \text{concat}(\ell_1, \ell_2)$ , then

$$\text{src}[e, f, g](\ell) = g(\text{src}[e, f, g](\ell_1), \text{src}[e, f, g](\ell_2)) ,$$

i.e. apply structural recursion to both sublists separately, then apply the operation  $g : T' \times T' \rightarrow T'$  to the resulting pair.

- (i) Discuss the conditions, under which  $\text{src}[e, f, g]$  is well-defined.
- (ii) Show how to use structural recursion to define operations on lists such as
  - determining the length,
  - applying a function to all elements of a list, and
  - creating a sublist of list elements satisfying a condition  $\varphi$ .
- (iii) Analyse the time complexity of structural recursion.

**total points: 14**

EXERCISE 3. Explain how to implement a FIFO queue using two stacks so that each FIFO operation takes amortised constant time.

**total points: 8**

EXERCISE 4.

- (i) Implement the function *delete\_last*( $\ell, k$ ) from Exercise 1 on the class `ALIST`.
- (ii) Implement your solution from Exercise 3 using the class `STACK`.

**total points: 20**
